

Provable yield on Sui.

A composable structured-product vault where **every number a vault tells you is cryptographically proven on-chain** — from the NAV, down to the silicon that signed it.

Most DeFi asks you to trust the number. Floe hands you the proof.

BUILT ON THE FULL SUI STACK

THE PROBLEM

Every vault asks you to **trust a number** nobody can verify.

Complex strategies move off-chain — opaque trading, manual operator wallets, black-box yield with no settlement proof. The "NAV" on the dashboard is a *claim*, not a fact. And claims break.

\$8.8B+

Lost to DeFi exploits YTD 2025 — recoveries under \$100M

\$52M

Oracle / valuation manipulation in 2024 alone — across 37 incidents

Valuation-logic exploits keep landing

Recent vaults drained by faking the very number they reported.

Drift · fake-asset collateral, 2026

\$280M

Resupply · inflated vault valuation, 2025

\$9.5M

Venus · oracle manipulation, ZKsync 2025

\$0.7M

Trust evaporates fast

Friktion — Solana's largest options-vault platform — peak to shutdown:

-97%

TVL collapse. No on-chain proof of what was ever really there.

A valuation is a **computation**, not a claim. So we make the computation prove itself.

Floe runs vault valuation inside a **Nautilus hardware enclave (AWS Nitro TEE)**, anchored to a measured-code fingerprint (PCR0). The enclave **signs** each result; a Move contract on Sui **verifies that signature on-chain** before any figure can move money.

01 · COMPUTE

Enclave values the vault

NAV, vol, collateral & risk computed inside an attested TEE — code identity proven by hardware.

02 · SIGN

Cryptographic attestation

The result is signed with a key sealed to the enclave — bound to its PCR0 measurement, never exported.

03 · VERIFY

Move checks it on-chain

`floe_nav::verify` validates the signature against the registered enclave — fully on-chain.

04 · REFUSE

No proof, no move

Unverified or stale figures are rejected; a circuit breaker halts on >5% NAV divergence.

Reported number vs. **proven floor** — the contract enforces the floor

Typical vault — self-reported "NAV"

unverifiable

Floe — enclave-proven floor

verified on-chain ✓

Click any figure in the app → land on the on-chain object, the verifier, the PCR0 measurement and the signature that backs it.
Nautilus compute on Sui via AWS Nitro Enclaves; integrity proven on-chain (sui.io/nautilus).

3-of-4

Proof intents live on-chain: NAV · Vol · Collateral (Risk reserved)

100%

Non-custodial & capability-gated — Floe can't move your funds itself

PCR0 `b4d53224...` — the on-chain anchor that ties every signature to one auditable build of the valuation code.

One verifiable vault engine. Four ways in.

Built natively on **DeepBook** and extended across venues — every position marked, every mark attested, every NAV backed by a hardware-proven floor.

Earn

Curated vaults deploy into DeepBook Predict liquidity, a lending sleeve & Cetus — each with a hardware-proven floor, not a marketing APY.

[Proven NAV](#)

Borrow

Lock vault shares and borrow against collateral whose value the contract verifies against an enclave signature. Trustless leverage on a trustless mark.

[Attested collateral](#)

Surface Studio

A live 3D implied-volatility surface reconstructed from DeepBook Predict's on-chain SVI oracles across ~18 expiries. Real skew, real term structure.

[Live on-chain data](#)

Deploy

Curators ship their own vault — venues, strata, risk policy & fees — with the same @floe/sdk we built on. Composability as a feature.

[Open SDK](#)

THE MOAT — THREE SUI-NATIVE PRIMITIVES DOING REAL WORK

Nautilus

Hardware-attested compute. The trust anchor that turns a valuation into a verifiable proof.

W Walrus

Durable, verifiable storage for the artifacts behind every attestation.

Seal

Access-gated data where confidentiality matters — privacy without sacrificing verifiability.

WHY FLOE WINS

Other vaults make you **trust the operator**. Floe makes the **contract verify the math**.

	 FLOE	 PENDLE	 ETHENA	 RIBBON	 CEGA	 YEARN
Hardware-attested valuation (TEE)	✓	×	×	×	×	×
NAV verified on-chain by contract	✓	PARTIAL	×	×	×	PARTIAL
Proven floor (not self-reported)	✓	×	×	×	×	×
Non-custodial & capability-gated	✓	✓	PARTIAL	PARTIAL	×	✓
Circuit breaker on NAV divergence	✓	×	×	×	×	×
Multi-venue with verified marks	✓	×	PARTIAL	×	PARTIAL	✓

A real, growing market — built on the wrong foundation

Structured-yield TVL (Sep 2025) \$13.3B

DeFi options-vault TVL ~\$1.0B

Pendle TVL peak (Sep 2025) \$13.1B

53.7% CAGR for DeFi → **\$231B** by 2030

Verifiability is the unlock for the institutional capital this market is chasing — and the one thing today's vaults can't offer.

Honest read: Pendle & Yearn are commendably on-chain for their core mechanics — but no incumbent *cryptographically proves* the valuation of complex, multi-venue strategies. That gap is Floe's wedge.

Sources: DL News / DeFiLlama (Pendle TVL); structured-yield & DOV TVL — DeFi research aggregates; DeFi CAGR 2025–30 market forecasts. PARTIAL = on-chain mechanics without attested valuation.

Not a deck promise — running on Sui testnet now.

Enclave attesting, real deposits, a real end-to-end **attested borrow executed on-chain**, and one-tap onboarding via Enoki zkLogin with sponsored gas — a first-time user with zero SUI can connect, deposit, and click straight through to the cryptography behind their balance.

What makes it defensible

- ✓ **A primitive, not a product:** one attested-valuation engine feeds Earn, Borrow & Vol — and any vault a curator deploys.
- ✓ **Native to the full Sui stack:** the only place Nautilus + Walrus + Seal + DeepBook compose into verifiable yield.
- ✓ **Trust-minimized by construction:** non-custodial, capability-gated, circuit-broken — proof is the foundation, not a feature.

Floe

**Most DeFi asks you to trust the number.
Floe hands you the proof.**
